301. Statute 144.496 may bring a civil action and recover damages and receive other equitable relief as determined by  
302. the court. Any such action must be commenced within two years after the date on which the buyer closed the  
303. purchase or transfer of the real Property.

333. **Q. WATER INTRUSION AND MOLD GROWTH:** Studies have shown that various forms of water intrusion affect many homes. Water intrusion may occur from exterior moisture entering the home and/or interior moisture leaving the home.

336. Examples of exterior moisture sources may be:

- improper flashing around windows and doors,
- improper grading,
- flooding,
- roof leaks.

341. Examples of interior moisture sources may be:

- plumbing leaks,
- condensation (caused by indoor humidity that is too high or surfaces that are too cold),
- overflow from tubs, sinks, or toilets,
- firewood stored indoors,
- humidifier use,
- inadequate venting of kitchen and bath humidity,
- improper venting of clothes dryer exhaust outdoors (including electrical dryers),
- line-drying laundry indoors,
- houseplants—watering them can generate large amounts of moisture.

351. In addition to the possible structural damage water intrusion may do to the Property, water intrusion may also result in the growth of mold, mildew, and other fungi. Mold growth may also cause structural damage to the Property. Therefore, it is very important to detect and remediate water intrusion problems.

354. Fungi are present everywhere in our environment, both indoors and outdoors. Many molds are beneficial to humans. However, molds have the ability to produce mycotoxins that may have a potential to cause serious health problems, particularly in some immunocompromised individuals and people who have asthma or allergies to mold.

358. To complicate matters, mold growth is often difficult to detect, as it frequently grows within the wall structure. If you have a concern about water intrusion or the resulting mold/mildew/fungi growth, you may want to consider having the Property inspected for moisture problems before entering into a purchase agreement or as a condition of your purchase agreement. Such an analysis is particularly advisable if you observe staining or musty odors on the Property.

363. **R. NOTICE REGARDING PREDATORY OFFENDER INFORMATION:** Information regarding the predatory offender registry and persons registered with the predatory offender registry under MN Statute 243.166 may be obtained by contacting the local law enforcement offices in the community where the property is located or the Minnesota Department of Corrections at (651) 361-7200, or from the Department of Corrections web site at <https://coms.doc.state.mn.us/publicregistrantssearch>.

# Radon in Real Estate Transactions

All Minnesota homes can have dangerous levels of radon gas. Radon is a colorless and odorless gas that comes from the soil. The gas can accumulate in the home. When inhaled, its radioactive particles can damage the lungs. Long-term exposure to radon can lead to lung cancer. About 21,000 lung cancer deaths each year in the United States are caused by radon.

The only way to know how much radon gas has entered the home is to conduct a radon test. MDH estimates 2 in 5 homes exceed the 4.0 pCi/L (picocuries per liter) action level. Whether a home is old or new, any home can have high levels of radon.

The purpose of this publication is to educate and inform potential home buyers of the risks of radon exposure, and how to test for and reduce radon as part of real estate transactions.

## Disclosure Requirements

Effective January 1, 2014, the Minnesota Radon Awareness Act requires specific disclosure and education be provided to potential home buyers during residential real estate transactions in Minnesota.

**Before signing a purchase agreement to sell or transfer residential real property**, the seller shall provide this publication and shall disclose in writing to the buyer:

- 1.** whether a radon test or tests have occurred on the property
- 2.** the most current records and reports pertaining to radon concentrations within the dwelling
- 3.** a description of any radon levels, mitigation, or remediation
- 4.** information on the radon mitigation system, if a system was installed
- 5.** a radon warning statement

## Radon Facts

**How dangerous is radon?** Radon is the number one cause of lung cancer in nonsmokers, and the second leading cause overall. Your risk for lung cancer increases with higher levels of radon, prolonged exposure, and whether or not you are a current smoker or former smoker.

**Where is your greatest exposure to radon?** For most Minnesotans, your greatest exposure is at home where radon can concentrate indoors.

**What is the recommended action based on my results?** If the average radon in the home is at or above 4.0 pCi/L, the home's radon level should be reduced. Also, consider mitigating if radon levels are between 2.0 pCi/L and 3.9 pCi/L. Any amount of radon, even below the recommended action level, carries some risk. A home's radon levels may change in the future, so test every 2–5 years, or sooner if there is major remodeling or changes to the foundation, heating, cooling, or ventilation.

## Radon Warning Statement

"The Minnesota Department of Health strongly recommends that ALL home buyers have an indoor radon test performed prior to purchase or taking occupancy, and recommends having the radon levels mitigated if elevated radon concentrations are found. Elevated radon concentrations can easily be reduced by a qualified, certified, or licensed, if applicable, radon mitigator.

Every buyer of any interest in residential real property is notified that the property may present exposure to dangerous levels of indoor radon gas that may place the occupants at risk of developing radon-induced lung cancer. Radon, a Class A human carcinogen, is the leading cause of lung cancer in nonsmokers and the second leading cause overall. The seller of any interest in residential real property is required to provide the buyer with any information on radon test results of the dwelling."

## Radon Testing

Any test lasting less than three months requires **closed-house conditions**. Closed-house conditions include keeping all windows and doors closed, except for normal entry and exit, and temperature set to 65 – 80 °F. For a full list of closed-house conditions please visit [mn.gov/radon/notice](http://mn.gov/radon/notice).

**Before testing:** Begin closed-house conditions at least 12 hours before the start of the radon test.

**During testing:** Maintain closed-house conditions during the entire duration of the short-term test. Operate home heating or cooling systems normally during the test.

**Where should the test be conducted?** Any radon test conducted for a real estate transaction needs to be placed in the lowest livable area of the home suitable for occupancy. This is typically in the basement, whether finished or unfinished. If other foundations are present, such as a crawl space or slab on grade, also test the rooms above these foundations.

### Place the test kit:

- 20 inches to 6 feet above the floor
- 3 feet from exterior doors and windows
- 1 foot from exterior walls
- away from heat sources and drafts caused by vents and fans
- not in enclosed areas or areas of high heat/humidity

### How are radon tests conducted in real estate transactions?

There are special protocols for radon testing in real estate transactions. Because these tests are time-sensitive there are two testing options. For both tests, test for a minimum of 2 days.

#### Continuous Radon Monitor (CRM)

MDH recommends CRMs in real estate testing. CRMs are calibrated, provide more data, and may detect tampering. The average of the results are used to make a decision to mitigate.

#### Simultaneous Short-Term Testing

Two short-term test kits are placed side by side, 4" – 8" apart. The results of the two tests are averaged and used to make a decision to mitigate.

## Radon Mitigation

When elevated levels of radon are found, they can be easily reduced by a licensed professional.

**Radon mitigation** is the process or system used to reduce radon concentrations in the breathing zones of occupied buildings. The goal of a radon mitigation system is to reduce the indoor radon levels to below the action level. This is done by drawing soil gas from under the house and venting it above the roof. A quality mitigation system is often able to reduce the annual average radon level to below 2.0 pCi/L. The cost of a radon mitigation system averages \$1,500 to \$3,000.

**After a radon mitigation system is installed** perform an independent short-term test to ensure the reduction system is effective. Operate the radon system during the entire test. This short-term test will confirm low levels in the home. Be sure to retest the house every two years to confirm continued radon reduction.

**All radon testing and mitigation should be conducted by licensed radon professionals.** Radon service providers, such as home inspectors, must be licensed. A list of these licensed radon professionals can be found at MDH's radon web site. MDH conducts free inspections, upon request, of recently installed radon mitigation systems, to check that they meet requirements.
